

HUMIC ACID

EFFICACY FOR TREATMENT OF ACUTE HEPATITIS C

***Laub BioChemicals Corporation
1401 Quail St., Suite 121
Newport Beach, CA 92660***

February 2006

FRONTISPIECE: Hepatitis C virus—the virus uses the rigid glycoprotein spikes on its surface to fuse to host cells.

Forward

This Report documents the progression of hepatitis C in a patient recently treated specifically for this disease. Although the origin of the infection is unclear, the patient most likely acquired the disease nosocomially (the patient had been hospitalized previously for abdominal surgery). The treatment consisted of injections of pegylated interferon alpha-2a, carried out together with the administration of ribavirin and humic acid.

Interferon was begun on Day 6—a Friday—following the initial diagnosis, and was continued thereafter once per week (Fridays) for 5 months. The dose was 1 mL, corresponding to 180 µg.

Ribavirin treatment (200 mg/tablet) was begun simultaneously with interferon administration. The dose was 3 tablets in the morning and 3 tablets in the evening, which was continued for 4 months. The dose was then reduced to 2 tablets in the morning and 2 tablets in the evening for an additional month.

Humic acid was administered in tablet form (250 mg/tablet), commencing with the onset of presentation of symptoms. Two tablets were taken in the morning and two in the evening, for 5 months. Humic acid treatment was thereafter reduced to one tablet in the morning and one in the evening.

The patient was a male Caucasian, age 25, in otherwise-excellent condition. The patient's overall physical appearance was that of a fit and muscular individual.

The preparation of natural-product and synthetic humate materials is described in U.S. patents 5,946,445; 6,569,416; 6,524,566; 6,524,567; 6,534,049; 6,576,229; and other U.S. and international patents and patents pending.

HEP C PCR QUANT
SPEC'M 05/26/05 10:30

! HCV QUANT 2,140,000 IU/ML/ML
! COMMENT

(NOTE)

The COBAS AMPLICOR HCV MONITOR v.2.0 quantitative test provides results in International Units (IU/ml; WHO International Standard of HCV RNA), and has a linear range from 600 IU/ml to 700,000 IU/ml.

Thus a result of <600 IU/ml does not necessary indicate that the patient is not infected with HCV.

! COMMENT The Hepatitis C RNA quantitation test is not currently FDA approved for diagnostic purposes. Results should be correlated with clinical findings and other laboratory test results.

!
! HEP C PCR QUAL .. NEGATIVE
! COMMENT
(NOTE)

A negative result does not
rule out the presence of virus
in
concentrations below the level
of detection by the assay.
